

-22-

What is Claimed is:

1. A molecular correlate diagnostic of schizophrenia comprising a nucleic acid encoding γ -adaptin, synaptic vesicle amine transporter, synaptotagmin 1, synaptotagmin IV, GABA transporter 1, synaptophysin, noradrenaline transporter, synaptotagmin V, phospholemman, NMDAR1-2A subunit, GluR2, GluR1, or $\alpha 7$ subunit.
2. A method of diagnosing schizophrenia in a patient comprising comparing in a cell or tissue of a patient relative levels of mRNAs for genes and expressed sequence tags differentially regulated in patients suffering from schizophrenia with mRNA levels of genes unaltered in schizophrenic patients.
3. A method of evaluating agents for treatment of a patient suffering from schizophrenia comprising:
 - (a) measuring in a cell or tissue of a patient levels of mRNAs for genes and expressed sequence tags differentially regulated in patients suffering from schizophrenia;
 - (b) administering to the patient an agent suspected of being a treatment for schizophrenia;
 - (c) re-measuring in a cell or tissue of the patient levels of mRNAs for genes and expressed sequence tags differentially regulated in patients suffering from schizophrenia; and
 - (d) comparing the levels of mRNAs measured in the cell or tissue before and after administration of the agent to determine whether the agent altered the mRNA levels of the patient.
